

One cannot help reflecting that psychiatry owes a great deal to Turner and men of his kind. His heart was in his work, and he was content to work for no material rewards. Unfortunately, in the past there has been but little inducement for men to give their lives to scientific work such as Turner accomplished. Things are better now, and there are a number of asylums where thoroughly well-equipped laboratories enable the medical officer of scientific bent to undertake research under extremely favourable conditions and with skilled guidance, but the pioneers of psychiatry who persisted in research with but little assistance, teaching or encouragement, should always be gratefully remembered. Amongst these must John Turner be numbered, and he did much to contribute to our knowledge of mental disorder.
