New Product Announcement

WHAT IS EXCEPTIONAL ABOUT
TOLNATE?

Attempts to find tranquillizers of lower toxicity have resulted in the development of more and more selective agents of this type. Safety has been bought at the expense of versatility.

'Tolnate' is unusual because it is both safe *and* versatile.

How Versatile?

'Tolnate' is a sedative-tranquillizer; it is also a potent antiemetic and it potentiates analgesics, anaesthetics and sedatives.

How Safe?

Trials so far have involved over 7,500 patients. There have been no reports of jaundice, agranulocytosis or other toxic effects due to 'Tolnate'. It does not cause allergic reactions and does not affect the extrapyramidal system.

The uses of 'Tolnate'

'Tolnate' has been used successfully in geriatrics, psychiatry and general medicine to sedate and tranquillize patients who are agitated, restless and aggressive. It is also valuable in surgery and obstetrics.

Please write for full information

U.K. Patent Nos. 607258 and 743495

CAN'T FIND HIS LAND- LEGS

Master Mariner, 42. Lost his command last year through failing eyesight. Physically in good shape (good appetite) but complains of increasing depression. Cheers up in company but feels 'very low' when alone, especially at end of day. Also has difficulty in getting to sleep. Unmarried—says the sea was his whole life and life ashore 'can't compare'.

Treatment:
Nardil

NARDIL is a monoamine oxidase inhibitor which acts selectively on the brain to resolve the depression.

NARDIL is safe and is effective at low dosage levels. Toxic effects on blood or liver are extremely rare.

NARDIL acts quickly. Response is usually seen within the first weeks or even days of treatment.

NARDIL provides reliable treatment for depressives—often the problem patients of a busy practice.

NARDIL has a simple and convenient dosage schedule, one tablet three times a day.

Available in bottles of 100 and 500 sugar-coated tablets each containing 15 mg. phenelzine.

HARVEY PHARMACEUTICALS

Clinical experience over a number of years has proved 'Stelazine' to be a powerful and versatile antipsychotic agent. It is effective equally in hyperactive patients, and in apathetic, withdrawn cases. It achieves rapid relief of hallucinations in schizophrenia, alcoholism and delirium tremens.

'Stelazine' has been used very successfully to control behaviour disorders in many types of mentally defective patients. It can be given concurrently with ECT to allay apprehension and post-shock excitement, and to improve the prognosis in schizophrenic patients. 'Stelazine' restores awareness and insight in psychosis; it facilitates psychotherapy by making contact possible between patient and physician.

'Stelazine' is available as: Tablets of 5 mg. Ampoules of 1 mg. Concentrate (containing 10 mg./ml.) Also tablets of 1 mg. and sustained-release 'Spansule' capsules of 2 mg.

for your epileptic patients

life can be normal with Trinuride

Trinuride helps the epileptic to lead a life fully active in every way, mentally as well as physically. Trinuride is often more effective in controlling epileptic seizures—and is almost entirely free from the drowsiness so often caused by other forms of treatment. Indicated in all epileptic conditions, Trinuride is especially useful in cases of grand mal and temporal lobe epilepsy. When you prescribe Trinuride you know that your patients are not progressively sinking, year by year, into a state of meaningless lethargy.

Trinuride is Phenylethylacetylurea 0.200 G

BASINGSTOKE ENGLAND

CLINICAL ELECTRO- ENCEPHALOGRAPHY

L. G. Kiloh and J. W. Osselton

135 pages Price 50s.

Dr. Kiloh and Mr. Osselton have produced a book mainly for the clinician. It is brief, modest but lucid, cogent and surprisingly comprehensive as a survey of existing knowledge.

Doubtless it will encourage more clinicians to seek to acquire expertise in this field and its qualities are such as to commend it to some neurophysiologists and to encourage them to become more familiar with and to enquire into the problems of the neuropsychiatric clinic and the EEG laboratory.

SPEECH DISORDERS

Sir Russell Brain

193 pages Price 42s.

Sir Russell has given a comprehensive account of a subject of great general interest, discussing theories of the origin of speech and its development in the child as well as its normal psychophysiology and break-down in aphasia. An historical account of thought about aphasia has been given, leading to a description of the symptoms of this and the closely related disorders apraxia and agnosia.

The whole is written in the spirit of a critical review founded on a particular thesis—that the key to the understanding of speech and its pathology is a physiological one, physiology being the link between the anatomy of the brain and psychology.

'There is no wisdom in useless and hopeless sorrow'

Samuel Johnson

One of the most persistent features in depressive illness is a feeling of futility. The patient is hopeless without adequate cause. There is no longer any depth in joy—or even in natural sorrow. The morbid cycle cannot be broken by lighter moments; there are no lighter moments. Guilt, self-depreciation, despair and the ever-present futility interlock in a grim pattern that can very quickly make life a dark parody, not purposeful, not even worth-while.

In the treatment of depressive illness, speedy relief of symptoms is often vital. And although drugs cannot solve all the patient's

problems, they can be immensely valuable in ridding the patient of his—or her—distressing symptoms and in helping to restore a normal view of life.

'Parnate'* is exceptional among antidepressants for the speed with which it takes effect. Response is usually well established within a week, and can be achieved even more rapidly by higher dosage. Similarly, the effects wear off quickly after discontinuance.

'Parnate' (brand of tranylcypromine) is available as tablets of 10 mg., in containers of 50 and 500. Full prescribing information will gladly be sent on request.

PARNATE* *A true antidepressant effect, quickly achieved*

as a potent antipsychotic agent

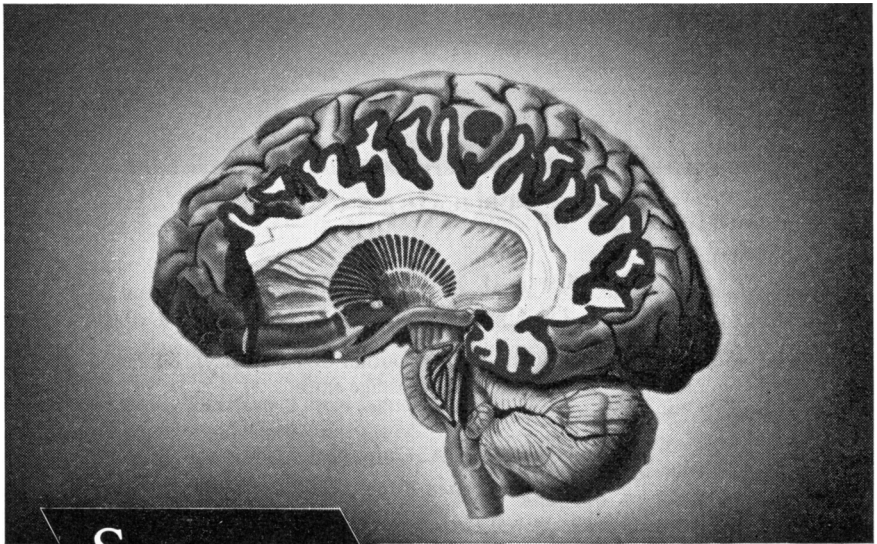

Serenace

brand of

haloperidol

SETS A NEW STANDARD

SERENACE is the first major advance in psychiatric chemotherapy since the introduction of reserpine and the phenothiazines and is the leader of a new class of drugs known as the butyrophenones. Already widely accepted in mental hospitals throughout the United Kingdom, it has been used for more than three years in Continental medicine where it is estimated that experience with SERENACE totals approximately 10 million patient/days of treatment.

Serenace

controls the major manifestations of psychotic illness

including **schizophrenic symptoms**

**delusions, hallucinations and paranoia
mania and agitation**

Full information is available
in a Physicians' Reference
Manual available on request.

(Serenace is a Registered Trade Mark)

SEARLE

INSTRUCTIONS TO AUTHORS

1. **Articles** must be typed with double spacing on quarto paper leaving generous margins.

2. The **title** should be brief and to the point, so as to give a clear idea of the nature of the work when quoted by others.

3. Names of **authors** only appear under the title of the paper. Names, qualifications, present appointments and postal addresses should be given in full at the end of the article.

4. **Past studies** need not be discussed where this has been done adequately elsewhere.

5. **Case histories** cannot be published unless they are of exceptional interest, and then must be short and confined to essentials.

6. **Tables** may be typed in the ordinary way.

Diagrams, drawings and graphs for reproduction must be drawn in black ink on white paper with proper lettering; it is preferable to draw diagrams $1\frac{1}{2}$ times larger than they are to be printed and on sheets not larger than quarto. If they have to be redrawn by the printer the cost, which may amount to several pounds, will be charged to the author. After printing, blocks are returned by the printers to the senior author.

7. **References** should be listed alphabetically at the end of the paper, the titles of journals being abbreviated as in the *World List of Scientific Publications*. Book titles are to be given with place of publication; as a rule titles of articles should not be quoted. For example:

1. ABEL-SMITH, B., and TITMUS, R. M. (1956). *The Cost of the National Health Service in England and Wales*. Cambridge.
2. ABERCROMBIE, P. K. (1960). *Brit. med. J.*, 2, 139.

If the number of references is small, and the author considers the titles of articles referred to are of interest, they may be quoted in the list of references. In this case all references to articles should be treated in the same way, and the titles of articles should be given without capitals, capitals being reserved for book titles.

In the body of the paper references should be by author and date; "Abercrombie (1960)". However in the case of review articles, with a large list of references and frequent quotation in the text, at the author's discretion the alternative method of reference by index number may be used.

Authors are expected to check the accuracy of all references in the MS. before submission. Corrections at a later stage are expensive and should be limited to printer's errors. A scrupulous re-check of the references should be made in the galley proof.

8. Passages intended for printing in small type should be so marked.

9. It is the author's duty to make himself clearly intelligible to the reader. In the assessment of papers great importance is attached to clarity of writing. It is usually wise to get the opinion of a colleague on writing and presentation before offering the paper for publication. Even experienced authors have blind spots for ambiguous or obscure passages. Great discretion is needed in the use of technicalities not generally understood among psychiatrists. Exponents of cybernetics, for example, must recall that the readers include those whose special training is in such a different field as psychotherapy; and *vice versa*.

10. Twenty reprints of each article are supplied free of charge; delivery instructions must be sent to the printers, Headley Brothers, Ashford, Kent. If authors require extra copies the orders must be sent direct to the printers at the time of passing the galley proofs.

Restoration after Confusion

Mental confusion, apathy, disorientation, loss of memory, coma and delirium occur non-specifically in diverse pathological states. Where confusional or psychotic symptoms are present, vitamins administered intravenously may be needed at the initiation of treatment, to restore to normal the disturbed intracellular glucose catabolism which may underlie the development of symptoms.

Parentrovite is the most highly concentrated injectable preparation of the vitamins necessary for restoring the patient's health. It contains massive doses of aneurine hydrochloride, nicotinamide, and ascorbic acid, and smaller doses of pyridoxine and riboflavine. It is prepared in two forms for intravenous and intramuscular injection. High potency and maintenance concentrations are available in each type.

National Health Service

In no case is the cost of a V.L. preparation greater than, and in some it is less than, that of the official equivalent preparation.

There is no official equivalent of some V.L. specialities.

Parentrovite

is a high potency injectable preparation
of the Vitamin B complex with Vitamin C
