Graph Theory 1736-1936

N. Biggs, E. K. Lloyd and R. J. Wilson

The central feature of this book is a set of thirty-seven extracts taken from the original writings of mathematicians who contributed to the foundations of graph theory. A linking commentary traces the historical development of the theme. Illustrated £9·50

The Mathematics of Diffusion

J. Crank

Though it incorporates much new material, this second edition preserves the general character of the book in providing a collection of solutions of the equations of diffusion and describing how these solutions may be obtained. There are two new chapters, on non-Fickian diffusion and on diffusion in heterogeneous materials. Second edition £12·50

Asymptotic Analysis

J. D. Murray

An introduction to asymptotic expansions is followed by chapters on the main technique for obtaining analytical approximations to integrals, the class of integrals which arise from Fourier and Laplace transform solutions of differential equations, and asymptotic methods for ordinary differential equations. £3.50

Numerical Solutions of Integral Equations

Edited by L. M. Delves and J. Walsh

This book introduces the principal problems and methods in the numerical solution of integral equations. Based on a Liverpool-Manchester Summer School held in July 1973, it includes contributions on quadrature methods and variational and general expansion methods for Fredholm and Volterra equations, eigenvalue problems, and integro-differential equations. £4·50

Solvable Models in Algebraic Statistical Mechanics

D. A. Dubin

This study of exactly solvable models contributes to the understanding of theoretical structures devised to explain physical phenomena. The structure examined in this book is quantum statistical mechanics, as adapted to systems with an infinite number of degrees of freedom, and the author analyses its standard of solvable models: the ideal Fermi gas, the ideal Bose gas, the BCS model of superconductivity, and the Ising model. Paper covers £5·25 *Oxford Science Research Papers*
