

logistics support (OSL) systems, and ensuring standardization through the establishment of subnational EMTs. These initiatives are supported by actionable steps with a monitoring and evaluation mechanism to ensure effective implementation.

Conclusion: The EMT Strategic Plan for Ethiopia is a critical document setting foundation for a responsive and resilient EMT. By integrating governance, collaboration, technology, training, logistics, and quality assurance, Ethiopia aims to create a world-class EMT system dedicated to saving lives and alleviating suffering during public health emergencies.

A Unified Government-Private Sector Strategy for Streamlined Singapore EMT Development

Raihan Rafiek

Ministry of Health, Singapore, Singapore

Background/Introduction: The episodic nature of crises necessitates the right-siting of resources. By leveraging the capabilities of the private sector, the MOH can remain focused on its core functions without being encumbered by logistics management and manpower concerns.

Objectives: In under 18 months, The Ministry of Health (MOH) of Singapore advanced the Singapore Emergency Medical Team (SGEMT) classification by adopting a whole-of-government and private sector collaborative approach.

Method/Description: In-depth appreciation of WHO EMT requirements and recognition of MOH own limitations, MOH tapped into the expertise of medical practitioners and incorporated insights from the Singapore Armed Forces and Singapore Civil Defence Force, who brought valuable experience from past humanitarian missions.

MOH made the strategic decision to outsource non-core functions such as warehousing, equipment maintenance, and ready-pool of technicians that can be rapidly mobilized. These functions were outsourced to a stringently selected service provider.

To complement these efforts, the MOH engaged in learning from regional partners, participating in study trips, and regional exercises. This ensured a comprehensive understanding of best practices from the EMT global community. Additionally, the MOH participated in regional disaster response framework, which includes the ASEAN EMT SOP.

The MOH's foresight in partnering with the Ministry of Foreign Affairs has fortified the SGEMT's global operational capabilities, ensuring support from Singapore's diplomatic network worldwide when required.

Results/Outcomes: This strategic alliance underscores Singapore's dedication to global health security and exemplifies a proactive approach to emergency preparedness and response, demonstrating the nation's readiness to tackle crises effectively.

Conclusion: This strategic alliance underscores Singapore's dedication to global health security and exemplifies a proactive approach to emergency preparedness and response, demonstrating the nation's readiness to tackle crises effectively.

Policy and Legislation Enablers for Regionalization of the Global EMT Strategy

Anna Borshevska MSc¹, Sergey Boyarskiy MD, PhD², Azat Botaliev MD³, Amiran Gogitidze MD⁴, Marta Catalinas⁵, Ram Vadi MD, MSc⁶, Oleg Storozhenko MD, PhD⁷

1. WHO Regional Office for Europe, Kyiv, Ukraine
2. WHO Regional Office for Europe, Istanbul, Türkiye
3. Ministry of Emergency Situations of the Kyrgyz Republic, Bishkek, Kyrgyzstan
4. Ministry of IDP's Labor, Health and Social Affairs, Tbilisi, Georgia
5. Spanish Agency for International Development Cooperation (AECID), Madrid, Spain
6. UK-Med, London, United Kingdom
7. WHO Regional Office for Europe, Copenhagen, Denmark

Background/Introduction: Research was conducted to identify needs for policy and legislation changes aimed at creating enabling environment for the implementation of the Emergency Medical Teams (EMT) Regional Action Plan 2024-2030 (RAP) to be facilitated by the WHO Regional European EMT Capability Hub (REECH).

Objectives:

- Establishing commonalities and differences in EMT-related policy and legislation in countries representing different subregions of the WHO/Europe.
- Informing the RAP policy and legislation framework development.

Method/Description: An analysis of the legal and normative frameworks governing EMTs in the selected countries – Spain, the UK, Georgia, Kyrgyzstan. The study involves reviewing legislative documents, policy frameworks, and operational guidelines that regulate EMTs' integration into national health systems and emergency response coordination mechanisms.

Results/Outcomes: Common characteristics of national legislation and policy frameworks include clear legal mandates, integration with national health systems, and alignment with national health policies. Differences identified: EMT governance and subordination (e.g., health sector in Georgia and UK, civil protection domain in Spain and Kyrgyzstan); patterns of international collaboration (e.g., stronger engagement with EUCPM for Spain, WHO guidance and support for Kyrgyzstan and Georgia).

Conclusion: The WHO European region's diversity informs different approaches to policies and legislation aimed at supporting RAP. Enablers include clear EMT mandates and their integration with national health systems and international

mechanisms. However, routes to these enablers vary due to differences in policies, health system design, and legislation adoption procedures. Future research will include more countries and a detailed list of research questions to identify patterns in legislation and policy enablers for achievement of the Global EMT goals.

Health Impacts of Climate-Change Related Natural Disasters on Persons with Disabilities in Developing Countries

Taslim T Uddin MBBS, FCPS, FRCP^{id}, Anika Tasnim, Mohammad Tariqul Islam

Bangabandhu Sheikh Mujib Medical University, Dhaka, Dhaka, Bangladesh

Background/Introduction: Persons with disabilities (PWD) in developing countries are particularly affected by climate change-related disasters.

Objectives: To explore the health impacts of climate change-related natural disasters on persons with pre-existing physical and mental disabilities in developing countries.

Method/Description: The Joanna Briggs Institute evidence synthesis guideline was applied and results were reported following PRISMA guidelines. PubMed, PsycINFO, Scopus, and Embase databases were searched using terms related to ‘persons with disabilities,’ ‘climate change,’ and “developing countries.” The database search retrieved 406 articles, forty-two articles were eligible for full-text review and 14 met the inclusion criterion which were reviewed and thematic analysis was performed.

Results/Outcomes: The 14 articles included 5 studies generalized across multiple countries and nine profiled specific developing countries. Five key themes were identified: impact on PWD physical health and mental health, resilience, and coping strategies of PWD in disasters, PWD involvement in inclusive disaster planning, and climate-change related natural disasters on PWDs in developing countries as a human rights issue.

Conclusion: Additional research is needed to better understand the negative health impacts of climate change-related natural disasters on persons with pre-existing physical and mental disabilities in developing countries. Contributing social and economic factors as well as facilitative coping and resilience strategies of the affected population in this context also require further study. Addressing these research gaps can inform development of effective, disability-inclusive disaster management practices which contribute to more equitable climate-change related health and rights-based outcomes for PWDs in developing countries. Resulting trauma can concomitantly result in increased acute demand for physical rehabilitation therapy services.

The Global Alarming Impact of Extreme Heat Waves: A Retrospective Analysis

Zakaria Ahmed Mani PhD^{id}

Jazan University, Jazan, Saudi Arabia

Background/Introduction: Extreme heat waves are a growing global health concern, with their frequency and intensity escalating due to climate change. Understanding past trends in heat wave impacts is crucial for informing effective mitigation and adaptation strategies.

Objectives: This study aims to analyze the historical impact of extreme heat waves on global mortality and morbidity, identifying geographical and temporal trends to inform public health interventions.

Method/Description: We conducted a retrospective analysis using data from the Emergency Events Database. This comprehensive database provided records of heat wave events and associated mortality and morbidity data spanning recent decades. Statistical analysis was performed to identify trends and patterns in heat wave occurrences and their health impacts.

Results/Outcomes: Our analysis reveals a concerning increase in both the frequency and severity of extreme heat waves globally. This trend corresponds with a significant rise in heat-related mortality and morbidity, particularly in regions with limited adaptive capacity and among vulnerable populations such as the elderly and those with pre-existing health conditions.

Conclusion: The findings underscore the urgent need for proactive measures to mitigate the health risks posed by extreme heat. These include strengthening healthcare infrastructure to manage heat-related illnesses, developing effective early warning systems, and implementing community-based interventions to reduce heat exposure. This research provides a critical historical perspective on the growing threat of extreme heat, emphasizing the importance of global cooperation and immediate action to protect populations from this escalating public health challenge.

How the Understated Role of Rehabilitation Within Emergency Responses Can Be Addressed: A Call to Action from the IFRC Technical Working Group

Jennifer Allen BKin MScPT, DPT

International Federation of the Red Cross (IFRC), Edmonton, AB, Canada. Qatar University, Doha, Qatar

Background/Introduction: The role of rehabilitation in EMTs remains unclear. Due to this and reasons related to inadequate initial planning, the role of rehabilitation professions in emergencies is understated. Further, there is no one-size-fits-all approach to rehabilitation in emergencies.

Objectives: The IFRC Rehabilitation Technical Working Group proposes solutions to address these challenges.
